# Labor Tracking Solution for SAP Business One

## Overview:

The LBSi Labor Tracking Solution was developed specifically for SAP Business One using the SAP SDK. The solution provides labor entry transaction functionality in SAP Business One™ that is not included in the standard product. Transactions can be entered against a production order or indirect labor code without directly logging into SAP Business One.

Transactions are real time and do not require any batch processes to run or generate. Unlike other labor tracking systems, the transactions are stored in the SAP Business One tables and as such the issue of the data not being in sync between an external labor systems and SAP Business One go away.

## Transactions Include:

- Direct labor entry
- Setup labor entry
- Indirect labor entry
- Move of finished goods or sub-assemblies to inventory
- Support of serial numbers for finished goods or sub-assemblies

## Transaction Screens Include:

- Clock on / Clock off (System calculates the actual times)
- Direct entry of labor hours (no clock on / Clock off)
- Direct entry of labor on a grid for all days and hours not yet posted
- Add comments to labor transactions
- Batch Number

## Configuration Options:

Since Companies may have unique processes and requirements and as such we offer the ability to configure our Labor Entry to meet your needs. Options include:

- Ability to display the total hours of the current work week
- Ability to log on to multiple production orders at the same time
- Ability to have multiple employees logged into the same production order, work center, and operation
- Set default labor type
- Ability to retain the employee on the screen who performed the previous transaction on the current terminal
- Require a password for the employee entering labor each time they are performing a labor transaction

## Clock/On Clock/Off Easy to Use Screen:

Employee clocks/on to a production order, chooses an operation and whether the transaction is direct labor, indirect labor, or setup. Screen confirms the production order that the user is clocked in to. Clocking off is as simple as logging back in as the program knows which production order(s) and operation(s) you are logged in to.

Option to allow users to report pieces complete and move to inventory upon completion. Supports serial numbers.

See image on page 4 for reference.
